

Abby JOHNSON

Thank you for reading this!

My mission - and my team's mission is simple: We're in the fight for life because we love. We see that every life, from the child in the womb, to natural death - and in between, including the abortion clinic worker's life, has incredible value and worth. We believe that abortion strips women of their dignity. We believe that motherhood is empowering. We believe that not giving into societal pressures to degrade oneself is empowering. We believe that that justice applies to every single human begin on this earth. We believe in redefining the pro-life movement.

Birth Control

Hormonal Birth Control

The truth about oral contraceptives is a hard pill to swallow. Their use is so widely used and accepted that we have ceased to think about what they really do. If you believe that life truly begins at conception, then oral contraceptives aren't your prescription. Since only about half of the women using birth control pills cease to ovulate, according to the manufacturers, how do they prevent pregnancy? Simple. These methods have a backup plan. Hormonal methods also work to thin the lining of the endometrium (uterine wall) so that a newly conceived human being (life begins at conception, right?) cannot implant on the uterine wall. Because the baby has nowhere to implant, they are spontaneously aborted. Here is information on just a few forms of hormonal and artificial birth control that comes directly from the manufacturers.

Did You Know?

The World Health Organization (WHO) ranks oral contraceptives as a Group 1 carcinogen.

Take A Look For Yourself:

ParaGard (Copper IUD) may cause:

The contraceptive effectiveness of ParaGard is enhanced by copper continuously released into the uterine cavity. Mechanism(s) by which copper enhance contraceptive efficacy include interference with sperm transport and fertilization of an egg, and possibly prevention of implantation.
www.paragard.com

Nuvaring, vaginal ring, warnings:

Combination hormonal contraceptives act by suppression of gonadotropins. Although the primary effect of this action is inhibition of ovulation, other alterations include changes in the cervical mucus (which increase the difficulty of sperm into the uterus) and the endometrium (which reduce the likelihood of implantation).

OrthoEvra (The Patch) risks:

NGMN is the active progestin largely responsible for the pregestational acting that occurs in women following application of ORTHO EVRA. NGMN is also the primary active metabolite produced following oral administration of NGM, the progestin component of some oral contraceptive products.

Ortho TriCyclen Lo Birth Control Pills, otherwise known as Combined Oral Contraceptives, may cause:

Combination oral contraceptives act by suppression of gonadotropin. Although the primary mechanism of this action is inhibition of ovulation, other alterations include changes in the cervical mucus (which increase the difficulty of sperm entry into the uterus) and the endometrium (which reduce the likelihood of implantation).

Mirena (Hormonal IUD) may cause:

Studies of Mirena have suggested that several mechanisms prevent pregnancy: thickens cervical mucus preventing passage of sperm into the uterus, inhibition of sperm capacitation or survival, and alterations of the endometrium.

Depo-Provera (The Shot) risks:

When administered at the recommended dose to women every 3 months, inhibits the secretion of gonadotropins which, in turn, prevents follicular maturation and ovulation and results in endometrial thinning. These actions produce its contraceptive effect.
